# INTRODUCTION TO ENDLESS RUBBER TIMING BELTS

In order to improve and make easier the designers' job, Megadyne has decided to simplify and reorganize most of the endless rubber timing belts in just one calculation handbook. In the following pages you will find all the needed information regarding technical calculation, sizes and data about Isoran, Isoran DD, Isoran RPP, Isoran RPP DD, Isoran Silver and Isoran Gold.

Our wide range of products with different power rates and several structures allows Megadyne always to find the best solution for a very wide spectrum of applications.

# INTRODUCTION TO ENDLESS RUBBER TIMING BELTS

Thanks to their features, Megadyne's Endless Rubber Timing belts can be used in a very wide range of applications like power transmission (or conveyor) such as:

- appliances
- pellet extruder machines
- wood cutting machines
- doobby loom machines
- food mixers
- cooling systems
- radio controlled cars
- power wheelchair
- flexible packaging machines
- carton industry

## STANDARD RANGE

**MXL • XL • L • H • XH • XXH**

**XL DD • L DD • H DD**

**RPP3 • RPP5 • RPP8 • RPP14 • SILVER5 • SILVER 2 8M • SILVER 2 14M  
GOLD8 • GOLD14**

**RPP5 DD • RPP8 DD • RPP14 DD**

# CLASSIFICATIONS

## CLASSIFICATIONS

Megadyne's Isoran transmission belts are rubber chloroprene based belts with glass cord suited for a very wide range of application in power transmission field. This type of belts puts together the advantages of gears and V-belts minimizing the drawbacks of both.

These belts allow:

- synchronous transmission
- high and constant angular speeds
- high efficiency
- resistance to peak loads
- low noise transmission
- no lubrication
- no maintenance
- linear speed up to 30 m/s

1) The body is made of high quality chloroprene compound having:

- high fatigue resistance
- high resistance to heat and environmental agents
- good resistance to mineral oils
- total shape keeping by the time

Hardness changes according to the kind of belt:

- 74 ShA for Isoran, Isoran DD, Isoran RPP and Isoran RPP DD
- 90 ShA for Isoran Silver and Isoran Gold

Silver and Gold belts have higher quality and features compound each to get higher performances.

2) Tensile member made of high module fiberglass cords, S and Z twisted, which grant:

- high breaking strength
- very good resistance to stresses
- no elongation by the time
- very good adhesion with the belt body compound

Gold belts have special high power K-glass cords.

3) Nylon fabric on the teeth treated to improve lubrication during working; this allows:

- extreme abrasion resistance
- low friction coefficient
- high transmission efficiency
- long belt and pulley operational lifetime

Gold belts have two Nylon fabric plies to improve the above features.

## PERFORMANCE COMPARISON INDEX

Please consider that the above graph is merely indicative.

## COATING

Isoran can be manufactured with special coating on the back side. Please check with our Application Department for more details.

## IDENTIFICATION CODE

Using the information in the table below, it is possible to identify the correct belt for every application. The code is composed of letters and numbers as the following examples:

|      |   |      |   |    |   |     |
|------|---|------|---|----|---|-----|
| 1    | + | 2    | + | 3  | + | 4   |
| 1400 | + | GOLD | + | 14 | + | M55 |
| 510  | + | H    | + |    |   | 075 |

- 1) This number indicates the pitch length of the belt. The value is in mm for belts with a metric pitch while it's in tenth of inch for the imperial pitches (MXL are the only coded in hundreds of inches).
- 2) This code, composed by letters, indicates the belt profile.
- 3) This number indicates the standard pitch of the belt. It is expressed in mm, and it's used only for belts with a metric pitch.
- 4) This code, composed by letters and numbers, indicates the belt width. The value is in mm for belts with a metric pitch, while it's in hundreds of inches for the belts with imperial pitches.

| <b>μ</b>             | -                | coefficient of friction between belt and guide | <b>z<sub>c</sub></b>      | -     | number of belt teeth                    |
| <b>p</b>             | -                | belt pitch                                     | <b>i</b>                  | -     | speed ratio                             |
| <b>MTL</b>           | N                | Max Traction Load                              | <b>z<sub>L</sub></b>      | -     | number of teeth on largest pulley       |
|                      |                  |  | <b>BS</b>                 | N     | Breaking Strength                       |

Max Traction Load is maximum acceptable traction on cords

Breaking Strength is the necessary load to break belt cord

## DRIVE CALCULATION PROCEDURE

### CALCULATION OF TRANSMITTED POWER

From Table 2 at page 7 select the appropriate service factor  $F_s$  according to:

- the type of the driven machine
- the engine class, depending on the ratio between the peak load over the rated load
- the service conditions (duty cycle category)

If you are designing a drive with a speed up ratio ( $i = n_1 / n_2 < 1$ ) you need to consider into the above mentioned Service Factor  $F_s$  the correction factor  $C_m$  as reported in the following table:

**TABLE 1 - C<sub>m</sub> FACTOR**

| Speed ratio<br>$i = n_1 / n_2$ | C <sub>m</sub> |
|--------------------------------|----------------|
| 1 ÷ 0,8                        | 0              |
| 0,79 ÷ 0,58                    | +0,1           |
| 0,57 ÷ 0,40                    | +0,2           |
| 0,39 ÷ 0,28                    | +0,3           |
| ≤ 0,28                         | +0,4           |

The corrected service factor  $C_c$  will be:

$$C_c = F_s + C_m$$

The design power  $P_c$  is obtained multiplying the input power by the corrected service factor:

$$P_c = P \cdot C_c$$

## TABLE 2 - SERVICE FACTOR $F_s$

| DRIVEN MACHINE  | DRIVER MACHINE  |                     |                    |  |                     |                    |  |                      |                    |

| Category 4: SHOCK LOAD/TORQUE<br>Textile machinery: dobbies, looms. Hammer mills. Paper machinery. Positive fan blowers. Reciprocating compressors. Machinery for pottery and earthenware. Centrifuges.   | 1,7   | 1,8                 | 1,9                | 1,9  | 2,0                 | 2,1                | 2,1  | 2,2                  | 2,3                |
| Category 5: HIGH UNIFORM LOAD/TORQUE<br>Crushers: roll, ball, jaw. Mills: ball, rod, pebble, etc. Reciprocating pumps. Saw mill equipment.  | 1,9   | 2,0                 | 2,1                | 2,1  | 2,2                 | 2,3                | 2,3  | 2,4                  | 2,5                |
| With reverse bending (eg. external idler)   | +0,1  |                     |                    |  |                     |                    |  |                      |                    |

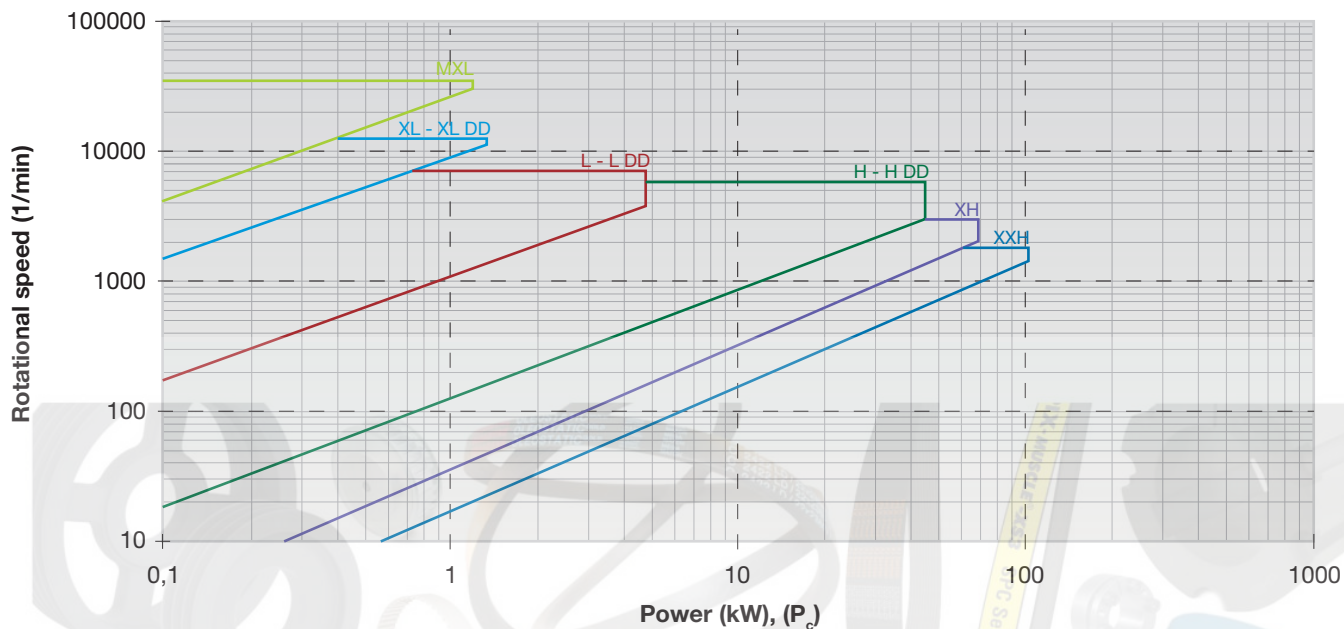

NOTE: these service factors are adequate for most of belt drive applications. Service factors can be substituted only where the input data and the working conditions are exactly known. In this case service factors may be adjusted based upon an understanding of the severity of actual drive operating conditions.

# TECHNICAL CALCULATION

## TABLE 3 - BELT PITCH SELECTION TABLES

### ISORAN AND ISORAN DD

HAJTASTECHNIKA  powered by

## RPP8, RPP8 DD, SILVER 2 8M AND GOLD8

## RPP14, RPP14 DD, SILVER 2 14M AND GOLD14

# TECHNICAL CALCULATION

## CHOICE OF BELT TYPE AND PITCH

Several options are available, starting from Isoran and improving the belt's power rate getting up to Isoran RPP, Isoran Silver and eventually Isoran Gold, as shown on the graphs in the previous pages 8 and 9.

The graph has:

- design power  $P_c$  along the X-axis
- speed of the fastest shaft along the Y-axis.

With these input data you will locate an intersection point. The area surrounding this point indicates the pitch you should use for your design. As shown, the most powerful belt is the Isoran Gold. If it is not enough, we suggest to consult our Platinum calculation handbook.

If you wish, you can compare and design different options, both in terms of power rate and pitch. Then you might select the drive best matching your size requirements or the most economical one.

## CHOICE OF PULLEY, BELT AND CENTRE DISTANCE

According to your space and speed ratio requirements, you might select the pulleys among those you can find in our Megapulley catalogue. To help you on the choice of the pulleys, you can use the below chart indicating a selection of possible pulleys that give you the needed speed ratio.

### TABLE 4 - SPEED RATIO TABLES

| Speed Ratio (approximate values) $z_2/z_1$ | $z_2/z_1$ |        |        |       |       |       |
|--|-----------|--------|--------|-------|-------|-------|
| 1,06                                       | 38/36     | 36/34  | 34/32  |       |       |       |

Please mind that the bigger is the pulley, the more will be the power the belt can transmit and the less will be the belt width; on the other side, a big pulley requires more space and will be heavier. Please mind that each pitch has its own minimum dimension; this value is given by the smallest available pulley in the corresponding Basic Performance table.

Speed ratio is: (1 refers to driver pulley: 2 refers to driven pulley)

$$i = \frac{n_1}{n_2} = \frac{z_2}{z_1}$$

- If speed ratio is equal to one,  $z_1 = z_2$ , belt length will be

$$L = 2c + \pi \cdot d_1$$

- If speed ratio is not equal to one and you have dimension limits on one of the two pulleys, you should consider this value and check on the Megapulley catalogue a pulley that can fit on your layout. Then, thanks to the formulas

$$z_1 = \frac{z_2}{i} \quad \text{and} \quad z_2 = z_1 \cdot i$$

you can also select the other pulley. Considering the centre distance  $c$ , the belt length  $L$  will approximately be:

$$L \approx 2c + 1,57(d_1 + d_2) + \frac{(d_2 - d_1)^2}{4c}$$

Once you find the needed belt length, both for speed ratio equal to one or not, you will proceed checking on our available belt lengths on belt data pages; you can choose both the closest longer or the closest shorter available belt. With the actual belt length value  $L_c$  you selected and the chosen pulleys you can find the new centre distance  $c_c$  as per shown below:

- If speed ratio is equal to one, the new centre distance will be

$$c_c = \frac{L_c - (\pi \times d_1)}{2}$$

- If speed ratio is not equal to one, you can use the following formula

$$c_c = \frac{1}{4} \left\{ L_c - \frac{p}{2}(z_1 + z_2) + \sqrt{\left[ L_c - \frac{p}{2}(z_1 + z_2) \right]^2 - 2 \left[ \frac{p}{\pi}(z_2 - z_1) \right]^2} \right\}$$

or you can use the centre distance table from page 24

In this table, you have:

- $z_c - z_1$  along the columns
- $z_2 - z_1$  along the rows

At the intersection of the given column and row you will find a number that is the centre distance in teeth number  $c_t$ ; so, multiplying this number by the pitch  $p$  you will get the actual centre distance:

$$c_c = p \cdot c_t$$

If one or both of the input values you have are out of the table's range, you should divide both values by two. Then, the calculated centre distance will be half than the real one, it means you need to multiply by two the found number to get the correct value of  $c_c$ .

We warmly suggest to check that the ratios between the belt's teeth number and the pulleys' teeth numbers are not integers. If this happens it is necessary to modify the drive wherever possible (centre distance, ratio, pulleys diameter) otherwise belt life could be massively reduced.

# TECHNICAL CALCULATION

## DETERMINATION OF THE ACTUAL POWER RATING $P_{ba}$

The actual power rating  $P_{ba}$  comes from the following formula:

$$P_{ba} = P_b \cdot C_d \cdot K_1$$

where:

- $P_b$  is the belt's basic performance; each belt type and each pitch has its own basic performance table; you can find it in belt data pages. It depends on driver pulley's number of teeth and on driver pulley speed.
- $C_d$  is the teeth in mesh correction factor. Because of power rating lists in this catalogue are based on a minimum of six teeth in mesh between the belt and the pulley, you have to consider this factor whenever you have less than six teeth in mesh because this will lead to an excessive tooth load. To determine the number of teeth in mesh on the smallest pulley you can use the following formula:

$$z_m = \left\{ 0,5 - \left[ \frac{4 p}{79 c} \cdot (z_1 - z_s) \right] \right\} \cdot z_s$$

where  $z_1$  is the number of teeth on the biggest pulley and  $z_s$  is the number of teeth on the smallest pulley.

Concerning  $z_m$ , always consider the bottom closest integer number. Based on this value, you will select the teeth in mesh correction factor  $C_d$  as per the following table:

### TABLE 5 - $C_d$ FACTOR

| Number of teeth in mesh $z_m$ | $C_d$ |
|-------------------------------|-------|
| 6 or more                     | 1     |
| 5                             | 0,80  |
| 4                             | 0,60  |
| 3                             | 0,40  |
| 2                             | 0,20  |

- $K_1$  is the belt length correction factor. Because of power rating lists in this catalogue are based on specific belt lengths, you have to consider this factor and choose  $K_1$  from the below Table, considering the actual belt length  $L_c$  you selected. For belt with imperial pitch, please use  $K_1$  equal to 1.

### TABLE 6 - $K_1$ FACTOR

## DETERMINATION OF BELT WIDTH

To find out the belt width we will find the width coefficient  $C_w$  first:

$$C_w = \frac{P_c}{P_{ba}}$$

Then, you can get the appropriate belt width  $b$  from the following tables. It is recommended to select the next higher standard width on the below tables. In this way you will get the needed belt width.

**TABLE 7 - BELT WIDTH FACTOR  $C_w$ , listed**

| Belt width ISORAN and ISORAN DD |       |       | $C_w$ , listed |
|---------------------------------|-------|-------|----------------|
| Code                            | mm    | inch  |                |
| 012                             | 3,0   | 1/8   | 0,09           |
| 019                             | 4,8   | 3/16  | 0,14           |
| 025                             | 6,4   | 1/4   | 0,18           |
| 031                             | 7,9   | 5/16  | 0,23           |
| 037                             | 9,5   | 3/8   | 0,30           |
| 044                             | 11,1  | 7/16  | 0,37           |
| 050                             | 12,7  | 1/2   | 0,45           |
| 062                             | 15,9  | 5/8   | 0,60           |
| 075                             | 19,1  | 3/4   | 0,72           |
| 088                             | 22,2  | 7/8   | 0,80           |
| 100                             | 25,4  | 1     | 1,02           |
| 125                             | 31,8  | 1 1/4 | 1,31           |
| 150                             | 38,1  | 1 1/2 | 1,58           |
| 175                             | 44,5  | 1 3/4 | 1,87           |
| 200                             | 50,8  | 2     | 2,17           |
| 250                             | 63,5  | 2 1/2 | 2,77           |
| 300                             | 76,2  | 3     | 3,41           |
| 350                             | 88,9  | 3 1/2 | 4,16           |
| 400                             | 101,6 | 4     | 4,84           |
| 500                             | 127,0 | 5     | 6,25           |
| 600                             | 152,4 | 6     | 7,68           |
| 700                             | 177,8 | 7     | 9,16           |
| 800                             | 203,2 | 8     | 10,67          |
| 900                             | 228,6 | 9     | 12,19          |
| 1000                            | 254,0 | 10    | 13,77          |

Widths in bold are standard widths, we suggest to choose among these.

Once the belt width is defined, it is possible to calculate the drive safety factor  $\sigma$ , the ratio between the actual belt power rating and the design power:

$$\sigma = \frac{\text{Actual Belt Power Rating}}{\text{Design Power}} = \frac{P_{ba} \cdot C_{w, \text{listed}}}{P_c}$$

This value will be higher than one if you choose the next higher standard width; it gives an indication of the maximum extra load that the belt can tolerate.

| 170             |                |                   | 5,33                |

# TECHNICAL CALCULATION

## PRE-TENSIONING

Pre-tensioning is needed to have a good belt running. If pretension  $T_s$  is too low, tooth jump can occur under the most sever load conditions; if it is too high it will increase the noise levels, reduce the belt life and may damage bearings, pulleys and other transmission parts.

The right pretension is obtained by the following formula:

$$T_s = \frac{500 \cdot P \cdot K_m}{v} + (m_1 \cdot v^2)$$

where:

- $T_s$  is the needed pretension on the pulleys' axes;
- $K_m$  is the factor of motor class, that considers the influence of motor peak torque; see the value in the below table:

## TABLE 8 - $K_m$ FACTOR

| CLASS A | CLASS B | CLASS C |
|---------|---------|---------|
| 1,35    | 1,50    | 1,75    |

- $v$  is the belt linear speed you can calculate with the following formula:

$$v = \frac{d_i \cdot n_i}{19100}$$

where diameter  $d_i$  is in mm and rotational speed  $n_i$  is in 1/min.

- $m_1$  is the mass per length unit; it changes according to the belt type and pitch. See the following table 9. For unusual, shock or pulsating loads we suggest to consult our Application Department for guidance. Axial load on bearings  $F_a$  will be equal to  $T_s$  when speed ratio is equal to one. Otherwise,  $F_a$  will be:

$$F_a = 2 \cdot T_s \cdot \sin \frac{\beta}{2}$$

where  $\beta$  is the angle of wrap as per Image 1 page 15.

In transmission with two pulleys, you can calculate  $\beta$  with the following formula:

$$\beta = 180^\circ - \arcsin \left( \frac{d_2 - d_1}{2c_c} \right)$$

## TABLE 9 - BELT MASS PER UNIT LENGTH (kg/m)

| Belt width |        | MXL   | XL    | L     | H     | XH    | XXH   | XL DD | L DD  | H DD  |

### STATIC TENSION CHECK

There are two methods to measure the correct static tension:

- a) The elongation method, based on measuring the force needed to deflect one span of the belt by a given amount (see below image).

Image 1

The force F to apply to deflect the belt F has to be:

$$\frac{T_s}{16} < F < \frac{1,5 \cdot T_s}{16} \quad (a)$$

The length of the free span t of belt where we will apply this force can be calculated as per below:

$$t = \sqrt{c^2 - \left(\frac{d_2 - d_1}{2}\right)^2}$$

The deflection distance f will be:

$$f = \frac{t}{64}$$

## TECHNICAL CALCULATION

With the belt installed on the drive and tensioned to remove all the slacks in the system (snug fit), you can begin the tensioning procedure. Put a force  $F$  on the centre of the free span  $t$  and deflect the belt up to a deflection  $f$  as per above calculation. Be sure that both pulleys are free to rotate. For belts wider than 50 mm put a rigid stuff like a key stock as wide as the belt and across it and apply the force through the rigid stuff to prevent belt distortion and to get a good result.

Once you get the right deflection  $f$ , measure the deflection force  $F$  and compare it with the formula (a) page 15:

- If the value is inside the range, pretension is right;
- If the value is higher than the maximum, the belt is too tight, the belt should be slightly slackened;
- If the value is lower than the minimum, the belt has not enough tension and has to be tightened.

If the value is out of range, please repeat this procedure until you will not get an inside range value.

- b) The vibration method, based on the use of a belt tension gauging equipment. This device consists of a small sensing head which is held across the belt to be measured. The belt is then tapped to induce the belt to vibrate at its natural frequency. The vibration are detected and the frequency of vibration is then displayed on the measuring unit. The relation between belt static tension  $T$  and the frequency of vibration  $f$  may be calculated using the following formula:

$$f = \frac{1}{2t} \cdot \sqrt{\frac{T_s}{m_1}} \quad \text{or} \quad T_s = 4 \cdot m_1 \cdot t^2 \cdot f^2$$

## CALCULATION EXAMPLE

### MACHINE DATA

$P = 30 \text{ kW}$   
 $n_1 = 1000 \text{ rpm}$   
 $n_2 = 500 \text{ rpm}$   
 $d_{2,\max} = 250 \text{ mm}$   
 Motor class: C  
 Application: textile  
 Type of driven machine: Not uniform torque (Cat 3)  
 Working hours: 8-16 h/day  
 Approximate centre distance: 650 mm

### CALCULATION OF TRANSMITTED POWER

According to the type of driven machine, the engine class and the service conditions we can find that the suggested service factor  $F_s$  is 2.0 according to table 2 page 7.

Because of the value of  $n_1$  and  $n_2$ ,  $i = \frac{n_1}{n_2} = \frac{1000}{500} = 2$ ,  $C_m = 0$

This means that corrected safety factor is:

$$C_c = F_s + C_m = 2 + 0 = 2$$

The design power is:

$$P_c = P \cdot C_c = 30 \cdot 2 = 60 \text{ kW}$$

### CHOICE OF BELT TYPE AND PITCH

Using the tables at page 8 and 9, having:

- $P_c = 60 \text{ kW}$
- Speed of the fastest shaft  $n_1 = 1000 \text{ 1/min}$

We will find that possible pitches are: XXH, RPP14, SILVER 2 14M, GOLD14 or even a GOLD8. All these belts are possible alternatives, to choose an higher power belt as Silver or even a Gold means to get a narrower belt than a less performing one.

We can choose the GOLD8.

### CHOICE OF PULLEY, BELT AND CENTRE DISTANCE (GOLD8)

Because of the maximum allowed pulley dimension,  $z_{2,\max}$  we can choose is

$$z_{2,\max} = \frac{d_{2,\max} \cdot \pi}{p} = \frac{250 \cdot 3,14}{8} \approx 98$$

Selecting from table at page 10, considering  $i = 2$ , a good combination option can be to use  $z_1 = 40$  and  $z_2 = 80$ , that is less than  $z_{2,\max}$ , with respectively  $d_1 = 101,86$  and  $d_2 = 203,72$  mm.

Because centre distance has to be close to 650 mm, we will firstly calculate the approximate belt length:

$$\begin{aligned}
 L &\approx 2c + 1,57(d_1 + d_2) + \frac{(d_2 - d_1)^2}{4c} = \\
 &= 2 \cdot 650 + 1,57 \cdot (101,86 + 203,72) + \frac{(203,72 - 101,86)^2}{4 \cdot 650} = 1783,75 \text{ mm}
 \end{aligned}$$

In our range we have 1760 and 1800 mm long available lengths. If you have layout problems, you might choose the shortest belt. Otherwise we can also choose the longest one, the 1800 mm long belt, with 225 teeth, that we choose; anyway both options are valid. We call this length  $L_c$ .

## CALCULATION EXAMPLE

The actual centre distance can be calculated:

- By the formula

$$c = \frac{1}{4} \left\{ L_c - \frac{p}{2} (z_1 + z_2) + \sqrt{\left[ L_c - \frac{p}{2} (z_1 + z_2) \right]^2 - 2 \left[ \frac{p}{\pi} (z_2 - z_1) \right]^2} \right\} =$$

$$= \frac{1}{4} \left\{ 1800 - \frac{8}{2} (40 + 80) + \sqrt{\left[ 1800 - \frac{8}{2} (40 + 80) \right]^2 - 2 \left[ \frac{8}{\pi} (80 - 40) \right]^2} \right\} = 658,029 \text{ mm}$$

- Using the tables from page 24. Had chosen a 225 teeth belt, it means that the corresponding  $z_c - z_1$  is 185, and having  $z_2 - z_1 = 80 - 40 = 40$ , we have a  $c_t$  of 82.254 (page 34). Multiplying this value by the pitch length, we will have the centre distance:

$$c = p \cdot c_t = 8 \cdot 82,254 = 658,032 \text{ mm}$$

Now we must check if the belt's number of teeth is not an integer multiple of the pulleys' number of teeth:

$$z_c / z_1 = 225 / 40 = 5,625 \qquad z_c / z_2 = 225 / 80 = 2,8125$$

These numbers are not integer, so they are acceptable.

### DETERMINATION OF THE ACTUAL POWER RATING (GOLD8)

To get  $P_{ba}$  we have to find out:

- $P_b = 11.20$  kW from table at page 73 knowing  $z_1$  (40) and  $n_1$  (1000 1/min).
- $C_d$  comes from the teeth in mesh number:

$$z_m = \left\{ 0,5 - \left[ \frac{4 p}{79 c} \cdot (z_1 - z_s) \right] \right\} \cdot z_s =$$

$$= \left\{ 0,5 - \left[ \frac{4 \cdot 8}{79 \cdot 658,032} \cdot (80 - 40) \right] \right\} \cdot 40 = 19,01$$

This means that there are more than 6 teeth mesh, so we can consider  $C_d = 1$ .

- $K_1$  comes from the belt length; because the chosen belt is 1800 mm long and has pitch 8 mm,  $K_1$  is 1,20 (table 6 page 12).

So: 
$$P_{ba} = P_b \cdot C_d \cdot K_1 = 11,20 \cdot 1 \cdot 1,20 = 13,44 \text{ kW}$$

### DETERMINATION OF BELT WIDTH (GOLD8)

Now we can find the width coefficient  $C_w$ :

$$C_w = \frac{P_c}{P_{ba}} = \frac{60}{13,44} = 4,46$$

The closest upper value in table  $C_{w,listed}$  is 4,75, (table 7 page 13) corresponding to 85 mm of width.

The final belt will be 1800GOLD8M85, with driver pulley's number of teeth equal to 40 and driven pulley's number of teeth equal to 80. The calculated centre distance is 658,032 mm.

The "Drive Safety Factor" can be calculated with the following formula:

$$\sigma = \frac{P_{ba} \cdot C_{w,listed}}{P_c} = \frac{13,44 \cdot 4,75}{60} = 1,064$$

## PRE-TENSIONING (GOLD8)

To get the right pretension on this belt we need to know:

- $K_m = 1,75$  because engine class is C;
- $v = \frac{d_1 \cdot n_1}{19100} = \frac{101,86 \cdot 1000}{19100} = 5,33$  m/s;
- $m_1$  is listed according to kind of belt, pitch and width; in this case it is 0,467 kg/m (table 9 page 15).

Because of these values, we will have:

$$T_s = \frac{500 \cdot P \cdot K_m}{v} + (m_1 \cdot v^2) = \frac{500 \cdot 30 \cdot 1,75}{5,33} + (0,467 \cdot 5,33^2) = 4938,22 \text{ N}$$

## SECOND OPTION

As previously written, it can be useful to compare more than one option. For example, choosing a GOLD14 we expect a narrower belt.

### CHOICE OF PULLEY, BELT AND CENTRE DISTANCE (GOLD14)

Because of the maximum allowed pulley dimension,  $z_{2, \max}$  we can choose is

$$z_{2, \max} = \frac{d_{2, \max} \cdot \pi}{p} = \frac{250 \cdot 3,14}{14} \approx 56$$

Selecting from table at page 10, considering  $i = 2$ , a good combination option can be to use  $z_1 = 28$  and  $z_2 = 56$ , that is less than  $z_{2, \max}$ , with respectively  $d_1 = 124,78$  and  $d_2 = 249,55$  mm.

Because centre distance has to be 650 mm, we will firstly calculate the approximate belt length:

$$L \approx 2c + 1,57(d_1 + d_2) + \frac{(d_2 - d_1)^2}{4c} = 2 \cdot 650 + 1,57 \cdot (124,78 + 249,55) + \frac{(249,55 - 124,78)^2}{4 \cdot 650} = 1893,69 \text{ mm}$$

In our range we have 1890 mm long available length  $L_c$ , that is very close to the needed one. It has 135 teeth. The actual centre distance can be calculated:

- By the formula

$$c = \frac{1}{4} \left\{ L_c - \frac{p}{2}(z_1 + z_2) + \sqrt{\left[ L_c - \frac{p}{2}(z_1 + z_2) \right]^2 - 2 \left[ \frac{p}{\pi}(z_2 - z_1) \right]^2} \right\} = \frac{1}{4} \left\{ 1890 - \frac{14}{2}(28 + 56) + \sqrt{\left[ 1890 - \frac{14}{2}(28 + 56) \right]^2 - 2 \left[ \frac{14}{\pi}(56 - 28) \right]^2} \right\} = 647,997 \text{ mm}$$

- Using the tables from page 24. Had chosen a 135 teeth belt, it means that the chosen  $z_c - z_1$  is 107, and having  $z_2 - z_1 = 56 - 28 = 28$ , we have  $c_i$  of 46.286 (page 29). Multiplying this value by the pitch length, we will have the centre distance:

$$c = p \cdot c_i = 14 \cdot 46,286 = 648,004 \text{ mm}$$

Now we must check if the belt's number of teeth is not an integer multiple of the pulleys' number of teeth:

$$z_c / z_1 = 135 / 28 = 4,82 \qquad z_c / z_2 = 135 / 56 = 2,41$$

These numbers are not integer, so they are acceptable.

# CALCULATION EXAMPLE

## DETERMINATION OF THE ACTUAL POWER RATING (GOLD14)

To get  $P_{ba}$  we have to find out:

- $P_b = 48,56$  kW from table at page 74 knowing  $z_1$  (28) and  $n_1$  (1000 1/min).
- $C_d$  comes from the teeth in mesh number:

$$z_m = \left\{ 0,5 - \left[ \frac{4 p}{79 c} (z_1 - z_s) \right] \right\} \cdot z_s = \left\{ 0,5 - \left[ \frac{4 \cdot 14}{79 \cdot 648,004} \cdot (56 - 28) \right] \right\} \cdot 28 = 13,14$$

This means that there are more than 6 teeth mesh, so we can consider  $C_d = 1$

- $K_1$  comes from the belt length; because the chosen belt is 1890 mm long and has pitch 14 mm,  $K_1$  is 0,95 (table 6 page 12).

So: 
$$P_{ba} = P_b \cdot C_d \cdot K_1 = 48,56 \cdot 1 \cdot 0,95 = 46,13 \text{ kW}$$

## DETERMINATION OF BELT WIDTH (GOLD14)

Now we can find the width coefficient  $C_w$ :

$$C_w = \frac{P_c}{P_{ba}} = \frac{60}{46,13} = 1,30$$

The closest upper value  $C_{w, \text{listed}}$  for standard width is 1,5 (table 7 page 13), corresponding to 55 mm of width.

The final belt will be 1890GOLD14M55, with driver pulley's number of teeth equal to 28 and driven pulley's number of teeth equal to 56. The calculated centre distance is 648.004 mm.

The "Drive Safety Factor" can be calculated with the following formula:

$$\sigma = \frac{P_{ba} \cdot C_{w, \text{listed}}}{P_c} = \frac{46,13 \cdot 1,5}{60} = 1,15$$

## PRE-TENSIONING (GOLD14)

To get the right pretension on this belt we need to know:

- $K_m = 1,75$  because engine class is C;
- $v = \frac{d_1 \cdot n_1}{19100} = \frac{124,78 \cdot 1000}{19100} = 6,53$  m/s
- $m_1$  is listed according to kind of belt, pitch and width; in this case it is 0,556 kg/m (table 9 page 15).

Because of these values, we will have:

$$T_s = \frac{500 \cdot P \cdot K_m}{v} + (m_1 \times v^2) = \frac{500 \cdot 30 \cdot 1,75}{6,53} + (0,556 \cdot 6,53^2) = 4043,6 \text{ N}$$

## THIRD OPTION

Now we just want to evaluate a SILVER 2 14M, that has a smaller power rating than GOLD14.

Geometrics and layout are the same as per GOLD14, so we can choose the same pulleys, the same belt length and the same centre distance already chosen for GOLD14. The main difference is about the power rating  $P_b$ .

## DETERMINATION OF THE ACTUAL POWER RATING (SILVER 2 14M)

To get  $P_{ba}$  we have to find out:

- $P_b = 27,67$  kW from table at page 68 knowing  $z_1$  and  $n_1$ .
- $C_d = 1$  as per GOLD14.
- $K_1$  is 0,95 as per GOLD14.

So:  $P_{ba} = P_b \cdot C_d \cdot K_1 = 27,67 \cdot 1 \cdot 0,95 = 26,28$  kW

## DETERMINATION OF BELT WIDTH (SILVER 2 14M)

Now we can find the width coefficient  $C_w$ :

$$C_w = \frac{P_c}{P_{ba}} = \frac{60}{26,28} = 2,28$$

The closest upper value  $C_{w, \text{listed}}$  is 2,5 (table 7 page 13), corresponding to 85 mm of width.

The final belt will be 1890SILVER 2 14M85, with driver pulley's number of teeth equal to 28 and driven pulley's number of teeth equal to 56. The calculated centre distance is 648,004 mm.

The "Drive Safety Factor" can be calculated with the following formula:

$$\sigma = \frac{P_{ba} \cdot C_{w, \text{listed}}}{P_c} = \frac{26,28 \cdot 2,5}{60} = 1,095$$

## PRE-TENSIONING (SILVER 2 14M)

To get the right pretension on this belt we need to know:

- $K_m = 1,75$  because engine class is C;
- $v = 6,53$  m/s as per GOLD14
- $m_1$  is listed according to kind of belt, pitch and width; in this case it is 0,850 kg/m.

Because of these values, we will have:

$$T_s = \frac{500 \cdot P \cdot K_m}{v} (+ m_1 \cdot v^2) = \frac{500 \cdot 30 \cdot 1,75}{6,53} + (0,850 \cdot 6,53^2) = 4056,14 \text{ N}$$

## THREE OPTIONS COMPARISON

The three options can grant similar performances even with different features.

GOLD14 will grant a narrower belt, that means narrower pulleys and less noise. Moreover, in this case we can also appreciate a smaller required tensioning compared to GOLD8, that will stress less all the machine components (shafts, bearings, etc.) or can allow a "lighter" sizing of them. This is also due to the fact that pulleys have bigger diameters. On the other side GOLD8 can be fitted on smaller pulleys (even in our example it is not an issue).

If we compare GOLD14 and SILVER 2 14M, we can see how wider than GOLD14 a SILVER 2 14M has to be to get the same result. So SILVER 2 14M will require wider pulleys and will give more noise than a GOLD14 because of the different widths.

All of these options will also have different cost levels.

For more details or any assistance, please contact our offices.

## BELT INSTALLATION

To correctly install the belts, you have to reduce the centre distance between the pulleys' axes or to loose the idler. If this axes are fixed or there is not enough idler's run, you have to take apart the pulleys, then to put the pulley inside the inner part of the belt and, finally, re-install the pulleys. Sometimes, to take apart just one pulley could be enough. Moreover, it is important to follow the following rules:

- Pulleys are properly aligned and axes very parallel;
- Avoid to force the belt on the pulley, even using tools; it might lead to cord cracks, that could be not visible.
- Be sure that axes are properly set up to avoid variation on the centre distance, pulley misalignment or not parallelism between the axes themselves.
- Install the belt with the proper tension.

Always mind that a low tensioned belt could lead to teeth jump, early wearing and vibrations; an over-tensioned belt could lead to early wearing and high noise.

# FORCES ON AXES AND BEARINGS

## FORCES ON AXES AND BEARINGS

The dynamic axial load is obtained by a vector addition between the tension in the tight span  $T_1$  and the one in the slack span  $T_2$  as shown in the below image 2. To calculate the dynamic axial load  $F_{a, dyn}$  you can use the following formula:

$$F_{a, dyn} = \sqrt{T_1^2 + T_2^2 - 2 T_1 T_2 \cos \beta} = \sqrt{\frac{T_e^2}{2} + 2 \times T_s^2 - 2 \cos \beta \left( T_s^2 - \frac{T_e^2}{4} \right)}$$

where:

- $T_e = \frac{1000 \cdot P}{v}$  with P the engine power in kW and v the belt speed in m/s;
- $T_s$  is the belt's pretension as previously calculated (page 14);
- $\beta$  is the wrap angle as previously calculated (page 14).

Knowing the load on the axis, it is now possible to calculate the load on the bearings according to the following formulas:

- If you have a system like image 3, where pulley is set outside the bearing's support:

$$F_1 = \frac{L_1 - L_2}{L_2} \cdot F_{a, dyn} \quad F_2 = \frac{L_1}{L_2} \cdot F_{a, dyn}$$

- If you have a system like image 4, where the pulley is between the two bearings:

$$F_1 = \frac{L_2 - L_1}{L_2} \cdot F_{a, dyn} \quad F_2 = \frac{L_1}{L_2} \cdot F_{a, dyn}$$

where:

- $F_1$  and  $F_2$  are the loads in N on the two bearings;
- $L_1$  is the distance between the pulley and the bearing;
- $L_2$  is the distance between the two bearings;

| Symbol       | Unit | Definition                          | Symbol | Unit | Definition                    |
|--------------|------|-------------------------------------|--------|------|-------------------------------|
| $\alpha$     | °    | Free span length angle              | $L_2$  | mm   | Distance between the bearings |
| $\beta$      | °    | Wrap angle on small pulley          | $M_1$  | Nm   | Motor torque                  |
| $d_1$        | mm   | Driver pulley pitch diameter        | $M_2$  | Nm   | Absorbed torque               |
| $d_2$        | mm   | Driven pulley pitch diameter        | $P$    | kW   | Motor power                   |
| $F_{a, dyn}$ | N    | Dynamic axial load                  | $P_a$  | kW   | Absorberd power               |
| $F_1$        | N    | Load on bearing 1                   | $T_1$  | N    | Tight span tension            |
| $F_2$        | N    | Load on bearing 2                   | $T_2$  | N    | Slack span tension            |
| $L_1$        | mm   | Distance between bearing and pulley |        |      |                               |

## CAUSES OF BELT FAILURE

To ensure that the performance and durability of a toothed belt drive will fully meet the requirements of particular application, it is necessary firstly to accurately select the drive and then to make sure the drive is correctly installed. If this procedure is not followed, the drive life and efficiency may be considerably reduced. The most frequent problems encountered, together with their probable causes, are listed in the table below. We hope that this will serve as a useful quick-reference guide, but if the drive problems persist or they are not identified in the following list please consult Megadine's Application Department

| Problems   | Causes  | Corrective action   |
|--|---|---|
| Abnormal wear of the belt<br>1. On side of tooth | <ul style="list-style-type: none"> <li>Belt excessively taut</li> <li>Excessive overloading</li> <li>Incorrect contour or diameter of pulley</li> </ul>   | <ul style="list-style-type: none"> <li>Reduce centre distance</li> <li>Use a wider belt</li> <li>Replace pulley after checking contour or diameter</li> </ul>   |
| 2. On the bottom of the tooth                    | <ul style="list-style-type: none"> <li>Excessive installation tension</li> </ul>  | <ul style="list-style-type: none"> <li>Reduce centre distance</li> </ul>  |
| 3. At the tooth root                             | <ul style="list-style-type: none"> <li>Incorrect diameter of pulley</li> </ul>  | <ul style="list-style-type: none"> <li>Replace pulley after checking diameter</li> </ul>  |
| 4. On the side of the belt                       | <ul style="list-style-type: none"> <li>Incorrect contour or diameter of pulley</li> <li>Misalignment or wrong setting of pulley</li> <li>Oscillation of axes and/or of bearing</li> <li>Flanges bent</li> </ul> | <ul style="list-style-type: none"> <li>Replace pulley after checking diameter</li> <li>Replace pulley after checking diameter</li> <li>Correct the positioning of the pulley and reinforce the bearing</li> <li>Straighten flanges</li> </ul> |

**ISORAN AND ISORAN DD**

## ISORAN AND ISORAN DD

Megadyne Isoran and Isoran DD belts are a class of belt very widely used in several kind of applications. These belts are made in polychloroprene compound. Special compounds with different features are available on request. Here under some belt's characteristics.

| Pitch             |    | MXL   | XL    | L     | H      | XH     | XXH    | XLDD  | LDD   | HDD    |
|-------------------|----|-------|-------|-------|--------|--------|--------|-------|-------|--------|
| Pitch length (mm) | p  | 2,032 | 5,080 | 9,525 | 12,700 | 22,225 | 31,750 | 5,080 | 9,525 | 12,700 |
| Teeth height (mm) | ht | 0,51  | 1,27  | 1,91  | 2,29   | 6,35   | 9,53   | 1,27  | 1,91  | 2,29   |
| Belt height (mm)  | H  | 1,14  | 2,40  | 3,60  | 4,40   | 11,40  | 15,30  | 3,05  | 4,60  | 5,90   |

Yellow area: at these conditions life's reduction is expected.

Light blue area: at these conditions linear speed exceeds 30 m/s, we suggest to use special pulleys.

Green area: both of the above conditions exist.

Yellow area: at these conditions life's reduction is expected.

Light blue area: at these conditions linear speed exceeds 30 m/s, we suggest to use special pulleys.

Green area: both of the above conditions exist.

Yellow area: at these conditions life's reduction is expected.

Light blue area: at these conditions linear speed exceeds 30 m/s, we suggest to use special pulleys.

Green area: both of the above conditions exist.

## ISORAN RPP AND ISORAN RPP DD

Megadyne Isoran RPP and Isoran RPP DD belts are a high power and high precision class of belt. Compared to Isoran Imperial, they can transmit more power in the same width or can allow a reduction of width to transmit the same power. This kind of belt uses a parabolic profile with the purpose to transmit more power and reduce the kind of accidents as tooth jump and to reduce noise.

The parabolic profile has a progressive pressure angle since the tooth root up to the top. This allows to have a taller tooth with the same pitch length. These two features lead to the following advantages:

- Reduction interference between the pulley and the belt and its related wearing coming from the torque peaks;
- Less noise;
- More resistance to tooth jump and to tooth shear;
- Higher transmittable torques;
- Less pre-tension.

Looking at the tooth design, it has a groove on the top. This allows a local deformation leading to the following advantages:

- A smoother engagement;
- A better meshing of the tooth in the pulley groove;
- A more uniform sharing of engaging teeth's stress;
- Less noise because of the smoother engagement;
- Less wearing because of the less slippage during engagement.

RPP profile have been designed even to be interchangeable with existing deep groove profiles and run on pulleys according to ISO 13050.

**ISORAN SILVER & SILVER 2**

## ISORAN SILVER AND SILVER 2

Megadyne Isoran Silver belts have been developed to give a more powerful alternative to Isoran RPP belts. Competing against high performance transmission systems, using chains and gears, that always have a disadvantage in terms of weight, noise, lubrication and maintenance costs.

Due to the greater power they can transmit compared to Isoran RPP, Isoran Silver can be used to improve and easily upgrade existing drives working with Isoran. Interchangeability is the key factor to flexible approach when upgrading with ISORAN SILVER, ensure that the other key equipments component are able to handle the increased transmitted power.

The new generation of RPP SILVER is made with materials of the highest quality and strength. Employing innovative manufacturing processes and techniques, the homogeneous construction of all components and a higher cohesive bond, imparts superior torque capacity, thus positioning the new SILVER 2 at a high performance level.

New SILVER 2 offers a wealth of improved properties and is distinguished above all, by the increased power capacity. Thanks to the use of “state of the art” materials, the SILVER 2 is particularly recommended for efficient and compact drives which experience high starting torques and allow the designer more flexibility due to the following advantages:

1. Increase of power load capacity by up to +50%, compared to the previous Silver; consequently more compact and lightweight drives are possible under the same power rating;
2. Break the equation “More Performance”=“More Cost”, as the Silver 2 retains the same selling price of the previous Silver generation, while offering a consistent improvement in performance;
3. Maintain the proven RPP tooth profile of Silver, thus continuing to give a full functional interchangeability with other deep profile systems;
4. Allows the existing RPP and SILVER systems to be upgraded without the necessity to replace the pulleys; thus extending the service life of existing drives at zero-cost.

The new SILVER 2 belts will be available in 8M and 14M pitches, with the same range of lengths of the previous SILVER generation. Each type will be available both in sleeves and single belts, maintaining the same basic dimensions and widths.

ISORAN SILVER 2 belts have RPP profile, designed even to be interchangeable with existing deep groove profiles and run on pulleys according to ISO 13050. Isoran Silver 2 8M and 14M belts are antistatic according to BS 2050. Isoran Silver 5M standard are not antistatic (available in antistatic version on request).

| Pitch             |    | SILVER 5 | SILVER 2 8M | SILVER 2 14M |
|-------------------|----|----------|-------------|--------------|
| Pitch length (mm) | p  | 5        | 8           | 14           |
| Teeth height (mm) | ht | 2,00     | 3,20        | 6,00         |

**ISORAN GOLD**

# ISORAN GOLD

Megadyne Isoran Gold belts have been developed to give a more powerful alternative to RPP and Silver belts to compete against high performance transmission systems using chains and gears, that always have a disadvantage in terms of weight, noise, lubrication and maintenance costs.

As for Isoran Silver, Isoran Gold can be used to improve and easily upgrade already existing drives working with both Isoran RPP and Isoran Silver. Also here, we always suggest to check that every other transmission component can bare the increased transmitted power, especially if you are going to replace an Isoran RPP, because of the wide power upgrade. GOLD timing belts offer to designers:

- Increased performance compared to Isoran RPP and to Isoran Silver.
- The possibility to keep using the same RPP pulleys.

Isoran GOLD belts have two nylon plies on the tooth to:

- Improve belt resistance to wearing;
- Reduce friction and noise levels.

Because of these features, replacing an Isoran RPP or an Isoran Silver with an Isoran Gold can allow:

- To reduce belt width thanks to the higher power rate; this allows also to reduce the required pulley width. They both lead to a significant transmission weight reduction.
- To reduce the pulley dimension thanks to the higher power rate; this leads to a lower belt linear speed and to the consequent noise reduction.

Gold belts have RPP profile, designed even to be interchangeable with existing deep groove profiles and run on pulleys according to ISO 13050.

Isoran Gold belts are antistatic according to BS 2050.

# SPECIAL EXECUTION FEASIBILITY

Megadyne can make special execution on customer's request to improve belt properties and to better suit to special applications.

## SUPER

---

On customer's request and with minimum quantity Megadyne can produce Isoran, Isoran RPP and Isoran Silver with a double nylon fabric on the tooth surface to improve torque carrying capacity. Isoran Gold has already two nylon fabric plies.

The advantages of this solution are:

- Exceptional resistance to abrasion
- Low coefficient of friction
- Increased drive efficiency
- Increased belt and pulley life.

This solution will increase the belt performances by a 10%.

## ANTISTATIC

---

On customer's request and with minimum quantity Megadyne can produce Isoran L, H, RPP5 and RPP8 in antistatic version according to BS 2050. We remind that Isoran Silver and Isoran Gold already comply BS 2050.

For very severe applications, Megadyne can also produce super-conductive belts overcoming BS 2050 parameters.

## HIGH TEMPERATURE

---

On customer's request and with minimum quantity Megadyne can produce special belts to work up to 130°C. Please check with our Application Department for advice or for even more severe requirement.

## SPECIAL COMPOUNDS

---

On customer's request and with minimum quantity Megadyne can also manufacture belts to stand to specific chemicals or environments as acids, oils, solvents, etc. Please check with our Application Department for guidance.

## LOW NOISE

---

On customer's request and with minimum quantity Megadyne can produce soft compounded belts (60 ±3 ShA) to reduce noise level. In this case, belt's performance will decrease by a 10% compared to an Isoran or an Isoran RPP.

## SPECIAL BRANDING

---

On customer's request and with minimum quantity Megadyne can brand the belts with special branding.

## SPECIAL PACKAGING

---

On customer's request and with minimum quantity Megadyne can package the belts following special customer's indications.

## PAINTING

---

For painting applications (as automotive painting shop) Megadyne suggest to use Megapaint, special suited and developed for this kind of application. Belts are available in RPP8 pitch and have the same performance of SILVER 2 8M. For further information, please check in Megapaint brochure or contact Megadyne's Application Department.

# USEFUL FORMULAS AND CONVERSION TABLE

## SPEED

$V$ : peripheral speed [m/s]  
 $n_1$ : rotation speed [RPM]  
 $d_1$ : pulley diameter [mm]

$$V = \frac{d_1 \cdot n_1}{19100}$$

$$n_1 = \frac{V \cdot 19100}{d_1}$$

$$d_1 = \frac{V \cdot 19100}{n_1}$$

## FORCES AND TORQUE

$F_u$ : peripheral force [N]  
 $M_t$ : drive torque [Nm]  
 $P$ : power [kW]  
 $n_1$ : rotation speed [RPM]  
 $d_1$ : pulley diameter [mm]  
 $V$ : peripheral speed [m/s]

$$F_u = \frac{19,1 \cdot 10^6 \cdot P}{d_1 \cdot n_1}$$

$$F_u = \frac{2000 \cdot M}{d_1}$$

$$F_u = \frac{P \cdot 10^3}{d_1}$$

$$M_t = \frac{P \cdot 9550}{n_1}$$

$$M_t = \frac{F_u \cdot d_1}{2000}$$

$$M_t = \frac{P \cdot d_1}{2 \cdot V}$$

## SPEED

$P$ : power [kW]  
 $F_u$ : peripheral force [N]  
 $M_t$ : drive torque [Nm]  
 $n_1$ : rotation speed [RPM]  
 $d_1$ : pulley diameter [mm]

$$P = \frac{F_u \cdot d_1 \cdot n_1}{19,1 \cdot 10^6}$$

$$P = \frac{M_t \cdot n_1}{9550}$$

$$P = \frac{F_u \cdot V}{1000}$$

## CUSTOMER DATA

Date \_\_\_/\_\_\_/\_\_\_

Company Name \_\_\_\_\_  
 Address \_\_\_\_\_ Zip Code \_\_\_\_\_  
 City \_\_\_\_\_ State \_\_\_\_\_ Country \_\_\_\_\_  
 Customer Name/Surname \_\_\_\_\_  
 Office \_\_\_\_\_ Tel. \_\_\_\_\_ Fax \_\_\_\_\_  
 e-mail \_\_\_\_\_

## DRIVE INFORMATION TRANSMISSION LAYOUT

### Power transmission

### Conveyor

Other ( If layout is different please sketch it below)

## DRIVE INFORMATION (FOR POWER TRANSMISSION)

### MOTOR:

AC      DC      Soft Start      Inverter  
 Power: \_\_\_\_\_  
 Speed: \_\_\_\_\_  
 Torque: \_\_\_\_\_  
 Acceleration: \_\_\_\_\_  
 Working time:    < 8h    From 8h up to 16h    24h

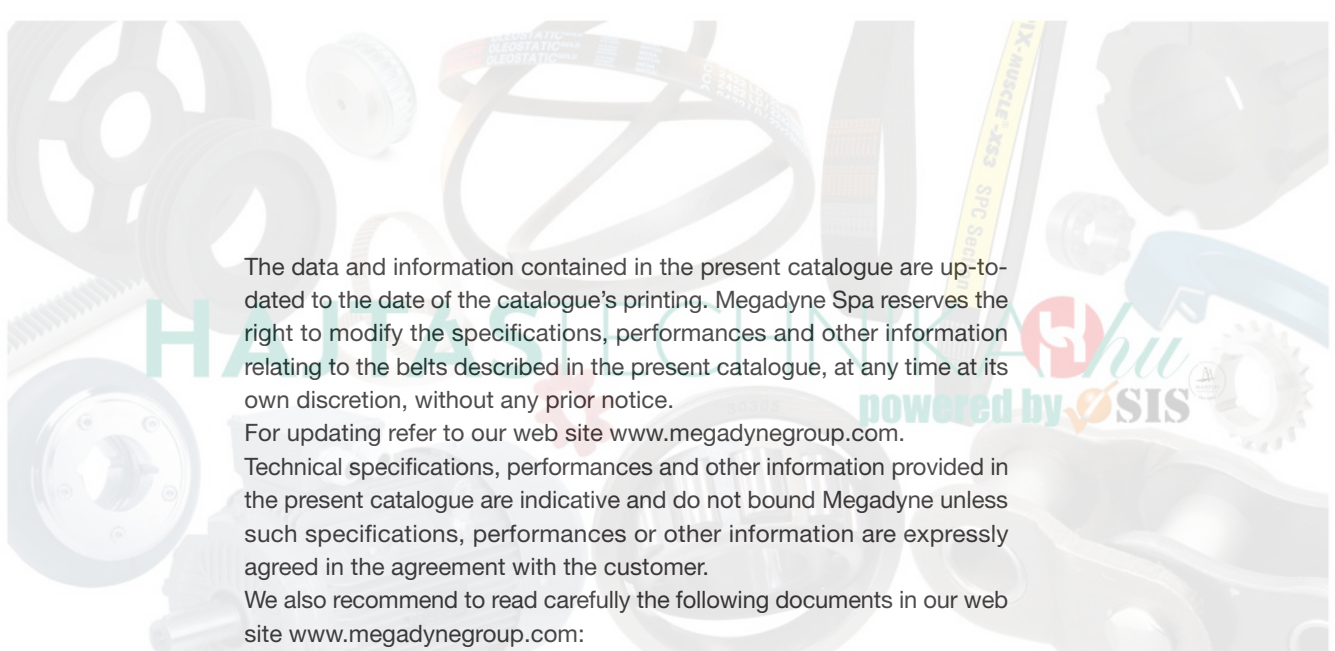

### APPLICATION:

Driver pulley 's diameter: \_\_\_\_\_  
 Driven pulley's diameter: \_\_\_\_\_  
 Center distance: \_\_\_\_\_  
 Minimum safety factor needed: \_\_\_\_\_  
 Are there any size limitation?    Yes    No  
 (if yes please indicate):  
 Max diameter: \_\_\_\_\_  
 \_\_\_\_\_  
 Max width: \_\_\_\_\_  
 Max center distance: \_\_\_\_\_

The data and information contained in the present catalogue are up-to-dated to the date of the catalogue's printing. Megadyne Spa reserves the right to modify the specifications, performances and other information relating to the belts described in the present catalogue, at any time at its own discretion, without any prior notice.

For updating refer to our web site [www.megadynegroup.com](http://www.megadynegroup.com).

Technical specifications, performances and other information provided in the present catalogue are indicative and do not bound Megadyne unless such specifications, performances or other information are expressly agreed in the agreement with the customer.

We also recommend to read carefully the following documents in our web site [www.megadynegroup.com](http://www.megadynegroup.com):

- Megadyne General Conditions of Sale (comprising the warranty)
- Theoretical Belt Life
- Drive Components: Storage, Installation, Maintenance and Troubleshooting Handbook
- Belts standard use condition and temperature.

Copyright Notice: Megadyne Spa copyright. All rights reserved. Megadyne is and shall remain the owner of all rights on drawings, technical specifications and any other information contained in the present catalogue or otherwise communicated by Megadyne Spa to the customer. The customer shall not disclose such information to third parties or use such information for purposes different from the definition of the order to Megadyne Spa, unless upon prior written authorization of Megadyne.
